

# IT Strategy Roadmap

## Aligning IT with the company's business goals

### What it Does

Logicalis looks at business- supporting IT operations to complete the following:

- Establish an IT strategy closely linked to corporate strategy and program areas
- Assess the current adequacy of IT to support current and future business needs
- Identify a required or desired future state of IT, including the preferred IT architecture
- Provide a three-year roadmap how to move from the current to preferred state of IT capability
- Assess and identifies risk

### What it Answers

- What does each of the business units require of information technologies and related services to meet its ongoing commitments?
- Are the existing IT investments optimised to provide the required services and delivered in the most cost effective way?
- What does the centralised IT/IS organisation currently perceive as the assumed service level requirements for meeting business unit operations requirements?
- What are the categories of quantified and qualified risks to continuous reliable IT services? What mitigation options are available?
- What does the most appropriate roadmap for the future look like taking advantage of available advancements in technology and cloud services?

Logicalis answers these questions in an organised manner through several document packages and live presentation sessions to the IT Team Management sponsor and decision-makers.
