

Logicalis Virtual Workspace

With the evolution of VDI, mobility has become more mobile.

Ever since the CEO and CFO started sending iMessages to each other on their iPhones and showing up at board meetings with iPads in their briefcases instead of laptops, the IT department's secure lock on corporate technology and corporate data was forever changed.

We're in the middle of a transformation of the traditional workspace desktop environment to one that is characterised by employees using mobile devices (such as smart phones and tablets) and working from home or remote locations to complete their daily tasks. The workforce has become increasingly more mobile – and is the driving force for a major shift to adopting their preferred personal device over employer-supplied IT equipment.

The consumerisation of IT takes momentum from the tele-working trend, which further escalates unified communications from nice-to-have to must-have technology. It used to be that you could single out a few businesses or industries that were considered mobile: healthcare, for example, professional services, and distribution. Today, all organisations are mobile businesses.

The good news is that the evidence is quickly mounting that the next wave of business growth and opportunity will come directly from an organisation's ability to embrace these new technologies.

- **Cost savings** (including reduction in HR related expenses, ability to recruit labour in low cost areas and reduced real estate costs)
- **Employee productivity** enabled by workshifting
- **Improved employee job satisfaction** and retention
- **Increased collaboration** between employees, partners and customers.

“The growing practice of introducing new technologies into consumer markets prior to industrial markets will be the most significant trend affecting information technology during the next 10 years.” – Gartner

Why do you need a Logicalis Virtual Workspace?

Logicalis is helping customers implement VDI and enable “Bring your Own Device” (BYOD) policies through our Virtual Workspace solution, with a solution that combines desktop and application virtualisation, voice and video in a virtual environment and mobile device management. In developing and deploying a solution, we address:

- **Network:** Do I have the network infrastructure to support all of these “foreign” BYOD devices securely and how do I cater for possible increased WAN traffic?
- **Data centre:** Do I have the necessary capability from a compute and storage perspective?
- **Collaboration:** Will the virtual workspace solution enable me to collaborate more effectively? Will voice and video perform in this environment?
- **Policy:** Do I have appropriate security in place? Actually, what is “appropriate” security? Are there legal or compliance issues we need to consider?
- **Culture:** Have I engaged the appropriate stakeholders? How do I build the business case and measure the benefits?
